# Historical Motivation

## Question

- Let  $X$  be a Banach space. What information about the linear *isomorphisms* of  $X$  can be gained from the linear *isometries*?

# Historical Motivation

## Question

- Let  $X$  be a Banach space. What information about the linear *isomorphisms* of  $X$  can be gained from the linear *isometries*?
- Partial Answer: **Not much!**

# Historical Motivation

## Question

- Let  $X$  be a Banach space. What information about the linear *isomorphisms* of  $X$  can be gained from the linear *isometries*?
- Partial Answer: **Not much!**
- (Bellenot, '86) Let  $X$  be a separable Banach space with norm  $\|\cdot\|$ . Then for all  $c > 1$  there exists an equivalent norm  $\|\!\|\!\cdot\!\|$  on  $X$  such that the only isometries on  $(X, \|\!\|\!\cdot\!\|)$  are  $\{1, -1\}$  and  $\|\cdot\| \leq \|\!\|\!\cdot\!\| \leq c\|\cdot\|$ .

## Question

- Let  $X$  be a Banach space. What information about the linear *isomorphisms* of  $X$  can be gained from the linear *isometries*?
- Partial Answer: **Not much!**
- (Bellenot, '86) Let  $X$  be a separable Banach space with norm  $\|\cdot\|$ . Then for all  $c > 1$  there exists an equivalent norm  $\|\|\cdot\|\|$  on  $X$  such that the only isometries on  $(X, \|\|\cdot\|\|)$  are  $\{1, -1\}$  and  $\|\cdot\| \leq \|\|\cdot\|\| \leq c\|\cdot\|$ .
- (Jarosz, '88) For **any** Banach space  $(X, \|\cdot\|)$  there exists an equivalent renorming  $\|\|\cdot\|\|$  such that the only isometries on  $(X, \|\|\cdot\|\|)$  are  $\{1, -1\}$ .

## Proof Strategy

## Proof Strategy

- Renorm Banach space  $X$  with an equivalent locally uniformly rotund (LUR) renorming.

## Proof Strategy

- Renorm Banach space  $X$  with an equivalent locally uniformly rotund (LUR) renorming.
- Add "pimples" to unit ball in order to do away with unwanted symmetries.

## Proof Strategy

- Renorm Banach space  $X$  with an equivalent locally uniformly rotund (LUR) renorming.
- Add "pimples" to unit ball in order to do away with unwanted symmetries.

**Can we do the same with arbitrary Banach lattices?**

## Proof Strategy

- Renorm Banach space  $X$  with an equivalent locally uniformly rotund (LUR) renorming.
- Add "pimples" to unit ball in order to do away with unwanted symmetries.

## Can we do the same with arbitrary Banach lattices?

- **Complication:** having an LUR *lattice* renorming is equivalent to being order continuous, so need a different approach when  $X$  is not order continuous.

## Proof Strategy

- Renorm Banach space  $X$  with an equivalent locally uniformly rotund (LUR) renorming.
- Add "pimples" to unit ball in order to do away with unwanted symmetries.

## Can we do the same with arbitrary Banach lattices?

- **Complication:** having an LUR *lattice* renorming is equivalent to being order continuous, so need a different approach when  $X$  is not order continuous.

## AM spaces

- A Banach lattice  $X$  is called an AM space if for any disjoint  $x, y \in X$ , we have  $\|x + y\| = \max(\|x\|, \|y\|)$ .

## Proof Strategy

- Renorm Banach space  $X$  with an equivalent locally uniformly rotund (LUR) renorming.
- Add "pimples" to unit ball in order to do away with unwanted symmetries.

## Can we do the same with arbitrary Banach lattices?

- **Complication:** having an LUR *lattice* renorming is equivalent to being order continuous, so need a different approach when  $X$  is not order continuous.

## AM spaces

- A Banach lattice  $X$  is called an AM space if for any disjoint  $x, y \in X$ , we have  $\|x + y\| = \max(\|x\|, \|y\|)$ .
- Any AM space is a sublattice of a  $C(K)$  space for some compact Hausdorff  $K$ .

## Proof Strategy

- Renorm Banach space  $X$  with an equivalent locally uniformly rotund (LUR) renorming.
- Add "pimples" to unit ball in order to do away with unwanted symmetries.

## Can we do the same with arbitrary Banach lattices?

- **Complication:** having an LUR *lattice* renorming is equivalent to being order continuous, so need a different approach when  $X$  is not order continuous.

## AM spaces

- A Banach lattice  $X$  is called an AM space if for any disjoint  $x, y \in X$ , we have  $\|x + y\| = \max(\|x\|, \|y\|)$ .
- Any AM space is a sublattice of a  $C(K)$  space for some compact Hausdorff  $K$ .
- Any sublattice  $X$  of  $C(K)$  is of the following form: there is an indexing set  $\mathcal{I}$  and a set of tuples:  $\{(s_i, t_i, \lambda_i) : i \in \mathcal{I}\}$  with each  $s_i \neq t_i$  and  $\lambda_i \geq 0$  such that  $X = \{x \in C(K) : \forall i \in \mathcal{I}, x(t_i) = \lambda_i x(s_i)\}$

# Main result

## Theorem 1

- Suppose  $(X, \|\cdot\|)$  is a separable AM-space, and  $C > 1$ . Then  $X$  can be equipped with an equivalent lattice norm  $\|\cdot\|_1$  so that  $\|\cdot\| \leq \|\cdot\|_1 \leq C\|\cdot\|$ , and the identity map is the only lattice isometry on  $(X, \|\cdot\|_1)$ .

# Main result

## Theorem 1

- Suppose  $(X, \|\cdot\|)$  is a separable AM-space, and  $C > 1$ . Then  $X$  can be equipped with an equivalent lattice norm  $\|\cdot\|_1$  so that  $\|\cdot\| \leq \|\cdot\|_1 \leq C\|\cdot\|$ , and the identity map is the only lattice isometry on  $(X, \|\cdot\|_1)$ .
- If  $X$  has no more than one atom, then  $\|\cdot\|_1$  can be chosen to be an AM-norm.

# Main result

## Theorem 1

- Suppose  $(X, \|\cdot\|)$  is a separable AM-space, and  $C > 1$ . Then  $X$  can be equipped with an equivalent lattice norm  $\|\cdot\|_C$  so that  $\|\cdot\| \leq \|\cdot\|_C \leq C\|\cdot\|$ , and the identity map is the only lattice isometry on  $(X, \|\cdot\|_C)$ .
- If  $X$  has no more than one atom, then  $\|\cdot\|_C$  can be chosen to be an AM-norm.

**Proof outline:**

- $D(m, n)$  is homeomorphic to  $D(n, m)$ .
- $D(m, n)$  and  $D(n, m)$  induce a map  $\phi_{mn} : D(m, n) \rightarrow D(n, m)$  such that for all  $f \in X$ ,  $f(s) = C^{n-m}f(\phi_{mn}(s))$ .

Let  $K'_n = K_n \setminus (\cup_{m < n} D(n, m))$ , and let  $K' = \cup_n K'_n$

# Structure

Let  $X$  be a  $C$ -regular AM space, with associated underlying  $K = \coprod K_n \cup \{\infty\}$ .  
For  $m \neq n \in \mathbb{N}$ , let  $D(m, n) :=$

$$\{t \in K_m : \exists s \in K_n \text{ such that } \forall x \in X, x(t) = C^{n-m}x(s)\}$$

- $D(m, n)$  is homeomorphic to  $D(n, m)$ .
- $D(m, n)$  and  $D(n, m)$  induce a map  $\phi_{mn} : D(m, n) \rightarrow D(n, m)$  such that for all  $f \in X$ ,  $f(s) = C^{n-m}f(\phi_{mn}(s))$ .

Let  $K'_n = K_n \setminus (\cup_{m < n} D(n, m))$ , and let  $K' = \cup_n K'_n$

- Atoms: characterized by "hereditarily" isolated points  $k \in K'_n$  for some  $n$ , such that  $\phi_{nm}(k)$  is also isolated whenever  $k \in D(n, m)$ . Induces  $\theta_k \in X_+$ , where  $\theta_k(\phi_{nm}(s)) = C^{m-n}$ , and  $\theta_k(t) = 0$  otherwise.

# Regular AM extensions

- Let  $X$  be a  $C$ -regular AM space with underlying sets  $K_n$ . A function  $f \in C(K_M \cup \dots \cup K_N)$  is **consistent** if  $x(s) = C^{n-m}x(\phi_m n(s))$  for all  $s \in K_m$ ,  $N \leq m, n \leq M$ .

# Regular AM extensions

- Let  $X$  be a  $C$ -regular AM space with underlying sets  $K_n$ . A function  $f \in C(K_M \cup \dots \cup K_N)$  is **consistent** if  $x(s) = C^{n-m}x(\phi_m^n(s))$  for all  $s \in K_m$ ,  $N \leq m, n \leq M$ .

## Proposition

- If  $x \in C(K_L \cup \dots \cup K_N)$  is consistent, then there exists an extension  $\tilde{x} \in X$  of  $x$  such that for all  $j > N$ ,  $\sup_{K_j} |\tilde{x}| \leq \max_{i \leq N} C_{i-j} \sup_{K_i} |x|$ .

# Regular AM extensions

- Let  $X$  be a  $C$ -regular AM space with underlying sets  $K_n$ . A function  $f \in C(K_M \cup \dots \cup K_N)$  is **consistent** if  $x(s) = C^{n-m}x(\phi_m^n(s))$  for all  $s \in K_m$ ,  $N \leq m, n \leq M$ .

## Proposition

- If  $x \in C(K_L \cup \dots \cup K_N)$  is consistent, then there exists an extension  $\tilde{x} \in X$  of  $x$  such that for all  $j > N$ ,  $\sup_{K_j} |\tilde{x}| \leq \max_{i \leq N} C_{i-j} \sup_{K_i} |x|$ .
- If, furthermore,  $y \in X_+$  such that  $0 \leq x \leq y$  on  $K_L \cup \dots \cup K_N$ , then  $\tilde{x}$  can be selected in such a way that  $0 \leq \tilde{x} \leq y$ .

# Point separation in regular AM spaces

**Lemma:** Suppose  $m \leq n$ ,  $t \in K'_m$ ,  $s \in K'_n$ , and  $U \subset K'_m$ ,  $V \subset K'_n$  are disjoint open sets with the property that  $t \in U \subset \overline{U} \subset K'_m$  and  $s \in V \subset \overline{V} \subset K'_n$ . Then for  $\alpha, \beta \in [0, \infty)$ , there exists  $x \in X_+$  so that:

# Point separation in regular AM spaces

**Lemma:** Suppose  $m \leq n$ ,  $t \in K'_m$ ,  $s \in K'_n$ , and  $U \subset K'_m$ ,  $V \subset K'_n$  are disjoint open sets with the property that  $t \in U \subset \overline{U} \subset K'_m$  and  $s \in V \subset \overline{V} \subset K'_n$ . Then for  $\alpha, \beta \in [0, \infty)$ , there exists  $x \in X_+$  so that:

- ① For  $j < m$ ,  $x|_{K_j} = 0$ .
- ②  $x(t) = \alpha$ ,  $x(s) = \beta$ ,  $x \leq \alpha$  on  $U$ , and  $x \leq \beta$  on  $V$ .
- ③ If  $m < n$ , then  $x|_{K_m \setminus U} = 0$ .
- ④ If  $m < n$ , then for  $m < j < n$ ,  $0 \leq x|_{K_j} \leq C^{m-j}\alpha$ .
- ⑤ On  $K_n$ ,  $0 \leq x \leq C^{m-n}\alpha \vee \beta$ .
- ⑥ For  $j > n$ ,  $0 \leq x|_{K_j} \leq (C^{m-j}\alpha) \vee (C^{n-j}\beta)$ .

# Duals of regular AM spaces

## Lemma 2

- *Suppose  $X$  is a regular AM space. Then  $X^*$  is lattice isometric to  $M(K')$ .*

# Duals of regular AM spaces

## Lemma 2

- Suppose  $X$  is a regular AM space. Then  $X^*$  is lattice isometric to  $M(K')$ .
- Denote by  $\mathcal{A}_1$  the set of normalized atoms in  $X^*$ . Equip  $\mathcal{A}_1$  with the weak\* topology. Then the map  $j : K' \rightarrow \mathcal{A}_1$ , with  $t \mapsto \delta_t$ , is a topological homeomorphism.

# Norm redefinition

- Denote the atoms in  $X$  by  $(\theta_i)_{i \in I}$ . each  $\theta_i$  corresponds to "hereditarily isolated" point  $a_i \in K'$ . Given  $C < 2$ , let  $c < \sqrt[3]{C}$ ,

# Norm redefinition

- Denote the atoms in  $X$  by  $(\theta_i)_{i \in I}$ . each  $\theta_i$  corresponds to "hereditarily isolated" point  $a_i \in K'$ . Given  $C < 2$ , let  $c < \sqrt[3]{C}$ ,

**(Galego, Ferenczi, Rosendal, ca. 2010-2015): Suppose  $(B, \|\cdot\|)$  is a separable real Banach space.**

- Let  $B$  have an LUR-norm  $\|\cdot\|$  and  $G \subseteq ISO(B, \|\cdot\|)$  with  $-1 \in G$ . Suppose there exists a normalized vector  $x_0$  such that  $\inf_{g \neq 1} \|gx_0 - x_0\| > 0$ . Then  $B$  admits an equivalent norm  $\|\cdot\|$  such that  $G = ISO(B, \|\cdot\|)$ .
- Let  $G$  be a closed subgroup of  $S_\infty$ . Then there exists a renorming  $\|\cdot\|$  of  $c_0$  so that  $G \times \{-1, 1\}$  is topologically isomorphic to  $ISO(c_0, \|\cdot\|)$ .
- For any Polish group  $G$ , there exists a separable Banach space  $B$  such that  $\{-1, 1\} \times G$  is topologically isomorphic to  $ISO(B, \|\cdot\|)$ .

## Question:

## Question:

- Given a Banach lattice  $E$  and Polish subgroup  $G \subseteq ISO_L(E, \|\cdot\|)$  of lattice isometries, when can  $E$  be renormed with an equivalent lattice norm  $\|\cdot\|$  so that  $G = ISO_L(E, \|\cdot\|)$ ?

## Question:

- Given a Banach lattice  $E$  and Polish subgroup  $G \subseteq ISO_L(E, \|\cdot\|)$  of lattice isometries, when can  $E$  be renormed with an equivalent lattice norm  $\|\cdot\|$  so that  $G = ISO_L(E, \|\cdot\|)$ ?

## Some partial answers:

- When  $E$  has a smooth, LUR lattice norm, a lattice analogue results like in the case of Banach spaces with LUR norms.

## Question:

- Given a Banach lattice  $E$  and Polish subgroup  $G \subseteq \text{ISO}_L(E, \|\cdot\|)$  of lattice isometries, when can  $E$  be renormed with an equivalent lattice norm  $\|\cdot\|$  so that  $G = \text{ISO}_L(E, \|\cdot\|)$ ?

## Some partial answers:

- When  $E$  has a smooth, LUR lattice norm, a lattice analogue results like in the case of Banach spaces with LUR norms.
- Theorem:** (Oikhberg, T.) Suppose  $X$  is a locally compact Polish space. Let  $G$  be a SOT-closed subgroup of the group  $\text{ISO}_L(C_0(X), \|\cdot\|)$  of lattice isometries. Suppose also that every orbit of  $G$  on  $X$  is nowhere dense and that  $G$  is equicontinuous on  $X$ . Then for all  $C > 1$ , there exists a renorming  $\|\cdot\|$  on  $C_0(X)$  such that  $G = \text{ISO}_L(C_0(X), \|\cdot\|)$  and  $\|\cdot\| \leq \|\cdot\| \leq C\|\cdot\|$ .

## Question:
