Geometry and deformation theory of heterotic systems: an overview

Xenia de la Ossa University of Oxford

Abstract:

The mathematical structure of quantum moduli spaces in string theory contains a wealth of information about the physical behaviour of the effective field theories. I will give an overview from various perspectives of what we know about the geometry and deformations of heterotic systems, which are associated to gauge bundles on manifolds with certain special mathematical structures. Time permitting, I will talk about a number of open problems.
